Structure and Function of a Fungal Adhesin that Binds

Heparin and heparan sulfate glycosaminoglycans are acidic complex polysaccharides found on the cell surface and in the extracellular matrix. Recent progress has uncovered a virtual explosion of important roles of these biopolymers in fundamental biological processes.

Heparin and heparan sulfate: biosynthesis, structure and

The primary structure of heparin and the mode of action of the heparinase and the heparitinase are proposed based on the analysis of the different products formed by the action of the enzymes.

Structure of Heparin - Journal of Biological Chemistry

The major limitations in utilizing heparin/HS-based oligosaccharides for a wide range of disorders are (1)

derivation of definitive structure–function relationships; and (2) the source and manufacturing of heparin has been optimized for high anticoagulant potency, which in essence becomes a side-effect, for nonanticoagulant applications.

Commentary Heparin sequencing brings structure to the function of complex oligosaccharides Matthew A. Nugent* Department of Biochemistry, Boston University School of Medicine, Room K420, 715 Albany Street, Boston, MA 02118

Heparin sequencing brings structure to the function of

function of heparin might be related to prevention of blood coagulation, since ... the proposition that heparan sulfate plays a specific role in cellular interactions. 3.2 Structure The heparin chains are covalently bound to serglycin core protein, whereas

Heparins and heparan sulfates. 1 Structure, distribution

Heparin, also known as unfractionated heparin (UFH), is a medication which is used as an anticoagulant (blood thinner). Specifically it is used to treat and prevent deep vein thrombosis, pulmonary embolism, and arterial thromboembolism. It is also used in the treatment of heart attacks and unstable angina.

Heparin is a sulfur-rich glycosaminoglycan with anticoagulant property. Heparin binds to antithrombin III to form a heparin-antithrombin III complex. The complex binds to and irreversibly inactivates thrombin and other activated clotting factors, such as factors IX, X, XI, and XII, thereby preventing the polymerization of fibrinogen to fibrin and the subsequent formation of clots.
