Vinod K. Tiwari, in Advances in Heterocyclic Chemistry, 2012. 1 Introduction. Heterocyclic compounds constitute the largest and most varied family of organic compounds significant to almost all aspects of modern organic chemistry, medicinal chemistry, and biochemistry. Among the approximately 20 million chemical compounds identified by the end of the second millennium, more than two-thirds are fully or partially aromatic and approximately half are heterocyclic.

XXVDI. Heterocyclic compounds with one heteroatom in the ring

Although heterocyclic chemical compounds may be inorganic compounds or organic compounds, most contain at least one carbon. While atoms that are neither carbon nor hydrogen are normally referred to in organic chemistry as heteroatoms, this is usually in comparison to the all-carbon backbone.

Heterocyclic compound - Wikipedia

Heterocyclic compounds may be classified into three types: (i) Five Membered, (ii) Six Membered and (iii) Fused or Condensed Heterocyclic compounds. Five-membered heterocyclic compounds bearing one more heteroatom The five membered membered heterocyclic compounds containing one heteroatom is shown in the figure 4.

An Introduction to Heterocyclic Chemistry

The 5-membered ring compounds containing two heteroatoms, at least one of which is nitrogen, are collectively called the azoles. Thiazoles and isothiazoles contain a sulfur and a nitrogen atom in the ring.
